LAN Storage Audit Tool
Identify Actual Storage Data

IT Directors and CIOs of small to mid-sized businesses face the difficulty of accurately assessing the data count across their network, and are typically less aware of potential data storage issues at each of their business locations.

RenovoData's **LAN Storage Audit Tool,** a unique and powerful resource, allows a business to thoroughly analyze the storage network before investing in a backup management solution. It reduces waste through providing a real-time trending of data storage at each operational facility.

The **LAN Storage Audit Tool** is a valuable instrument that can be used to analyze the entire concentration of data on the LAN by generating reports that will reveal idiosyncrasies and characteristics of data behavior within the storage architecture and at remote sites.

By implementing the LAN Storage Audit Tool at each location, the business manager can assess their information to differentiate mission-critical data from less frequently used important data. Most importantly, a comprehensive backup strategy tailored to a customer's particular remote backup and storage needs can be effectively planned.

LAN Storage Audit Reports
An easy, non-intrusive software installation on your network, the LAN Storage Audit Tool repeatedly scans and collects detailed information about stored data. Users are allowed to create a number of customized web-based reports, which present key results in multiple formats, including HTML, Microsoft Excel or plain text. These reports include such information as file size, ownership and residency within the company, duplicated data and modification statistics.

Administrative Empowerment
Take complete control of data while lowering the cost of managing data on the server with the RenovoData LAN Storage Audit Tool. From single users to enterprise-wide networks, the scalable LAN Storage Audit Tool can help reclaim wasted disk space, isolate problem storage areas and experience direct savings for the organization's IT Budget.

Maximize your Data Storage
The LAN Storage Audit Tool will give your business the capacity to:

- Identify dormant data
- Eliminate duplicate files
- Accurately count each file type
- Determine data relevancy
- Isolate storage issues
- Increase server availability
- Reduce backup window time
- Determine critical files
- Optimize network disk space
- Save money

RenovoData offers the LAN Storage Audit Tool as a standalone solution or as part of our remote backup service.
